

FIND YOUR FIT

A size classification model

When people buy clothes online, in many cases, people do not get the required size of clothes as they are unable to find the accurate fit or measurements for them online. Hence customers are not satisfied and end up having to request for a replacement or an exchange. This AI model, Find Your Fit, detects the size of a person from the image uploaded by them and suggests to the customer the appropriate size, which is supposed to fit them.

Details:

- ❖ For training the models, front view and side view images of a person are considered.
- ❖ In the front view image, using the GrabCut method, the foreground of the image is extracted.
- ❖ This extracted image is masked to obtain the required part of the image. It is then converted into grayscale.
- ❖ After this, the outline of the masked image is drawn using contours.
- ❖ The values of the largest edges of the contours drawn is considered, both vertically and horizontally, and a bounding box is drawn around the extracted image with those values.
- ❖ All these steps are repeated for the side view image as well.
- ❖ From the bounding boxes, the height and width of the image within the Region of Interest (ROI) is obtained.
- ❖ Using these measurements, the average/approximate size of the user is displayed.

Benefits:

- ❖ Better online shopping experience for customers.
- ❖ Results in reduced return rates.
- ❖ Customer gets almost accurately fitting clothes.
